Changes in Health & Safety Legislation mean changes in how we work!

The Traditional Builders Trestle is a cost effective and practical solution to working at height, and is favoured by both Professional Builders and the DIY enthusiast. They afford the user a substantial platform the width of 4 standard scaffold boards, and are used in such operations as brick/block laying, plastering, painting and general maintenance. Particularly in areas where it is not practical to erect access system platforms or tube & fitting scaffold.

But times have changed and those who hire, buy and use trestles need to protect themselves, their customers and their employees from the risk of falling from them, and then having to deal with the human, financial and social **cost a fall from height** can often bring with it. Not to mention the legal implications of failing to comply with the new "Working at Height" regulations.

We now have a device that allows use of Builders Trestles and has the ability to give a cost-effective solution to creating a system that can be fully hand-railed, with the added benefit of stabilising the platform. The "Trestle Handrail Adaptor" is compatible with either Aluminium Tube or conventional Scaffold Tube and Fittings. It is simple to fit, and only one bolt needs to be tightened to secure the vertical tube. When in place the Clamp cannot lift as it is secured by the boards and is prevented from sliding by the trestle board stop.

The system can be easily erected by two competent operatives following our simple user guide.

ADDITIONAL FEATURES

Compatible Trestles can attach together to give additional support & form loading bays if required (6).
The Trestle Handrail Adaptor is compatible with tube & fitting scaffold components.

SAFETY NOTICE

The outriggers on Figure (5) are **NOT** optional and must be used.
